

ABSTRACT OF THE DISCLOSURE

To prevent a computer to be managed from being omitted in software-property management which manages, for each computer, basic information thereof, installed software, and fix-patch
5 application status, an omission-in-software-property-management detection method using a network is provided. A network-connected-computer list which holds, for all computers connected to a given network, information for identifying each computer, and a software-property management list which holds,
10 for all computers to be managed by the software-property management, information for identifying each computer, are used as a basis on which a computer is extracted that is present in the network-connected-computer list and absent in the software-property management list. And a list is created of a
15 computer omitted in software property management.
